

METHOD AND APPARATUS FOR STORAGE AND RETRIEVAL OF CONNECTION DATA IN A COMMUNICATIONS SYSTEM

ABSTRACT OF THE DISCLOSURE

A method and apparatus for improved communication in a communications system is disclosed. The improvement involves storing connection data at a client end of a client-server connection within a communications system. Connection data is transmitted from a server communications device to a data access device. This connection data history can later be retrieved and analyzed by a server communications device to assist in the optimal configuration of communication sessions between the data access device and the server communications device within the communications system.
